

Stem Injection System reflects on decade of success

As it approaches its tenth anniversary in the UK and European market, Stem Injection Systems (SIS) make its annual return to Saltext reflecting on the enormous progress it has made since its launch almost a decade ago.

This innovative, patented stem injection system offered a very alternative approach to the treatment and management of invasive, non-native plant species when first launched in 2004, but is now increasingly seen as the treatment norm on more and more tender specifications.

With stem injection now commonplace on a significant number of riverbank, parkland and amenity projects, SIS has continued to develop and improved range of equipment and accessories for contractors and grounds maintenance teams.

Dedicated contractor packs, a new improved range of workwear and personal protection equipment and mobile and static chemical safes for the safe transport and storage of herbicides, are all now part of the extended SIS range being exhibited at SALTEX.

Attendance at SALTEX and renewing face to face contact with many existing and potential contractor customers, will once again reinforce just how far stem injection has come over the past decade. Joint Managing Director, David Layland said: "Stem injection was something very different and untried when we first introduced it into the UK and European market. Today, it is the preferred choice on more and more large scale treatment programmes and SALTEX provides the opportunity to reflect on that journey and underline its continued success."
